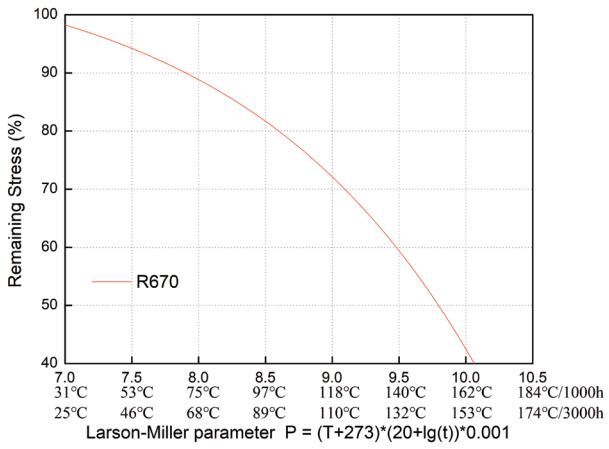
Thermal Stress Relaxation



P=Larson Miller parameter
T=temperature(℃)
t=time(h)
Example:
Application conditions: Maintain for 1000 hours at 100°C.
Formula substitution: T＝100, t＝1000
P=(100+273)×(20+lg (1000))×0.001=8.579
Graph reference: When P＝8.579, the stress retention rate is approximately 81%.
Conclusion: Under the conditions of 100°C /1000h, the remaining stress of this material is close to 81%.

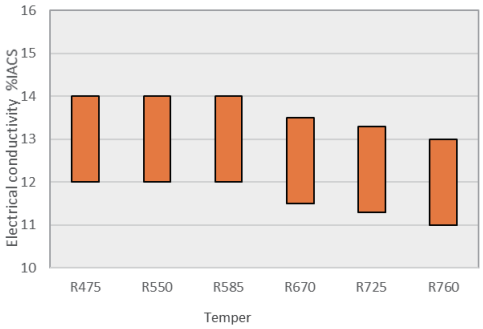
Electrical Conductivity



Fatigue Strength

The fatigue strength is defined as the maximum bending stress amplitude which a material withstands for 10.000.000 load cycles under symmetrical alternate load without breaking. It depends on the temper selected and can be estimated typically by 1/3 of tensile strength.
